Oscenia ERP — BRD: Project Management & Event CRM

Sep 27, 2026 · @Rahul

1. Purpose and scope

The client has asked for two new modules in the Oscenia ERP: an internal **Project Management workspace with team chat**, and a client-facing **Event Invitation, RSVP and Check-in system feeding a CRM**. This BRD is written from the client call transcript and is the basis for a front-end-only prototype; backend work starts after client sign-off.

Item	Value
Version	0.2 (client decisions applied)
Source	Client discussion transcript
Module A	Project Management + Team Chat (internal staff)
Module B	Event Invitation + RSVP + QR Check-in + CRM (Oscenia staff and their event clients / guests)
Delivery	Clickable FE prototype in existing ERP, mock data, no backend

2. Module A — Project Management

Management needs one place to see, across Projects A, B, C, D, who the PIC is, what is pending, what is blocked and why — with each role seeing only what they should.

2.1 Objectives

- See all projects in one view: PIC, pending tasks, status, deadline.
- Know where work is blocked and record why.
- Full trail per task: who assigned it, who received it, when, and when it was completed.
- Approval step before a task is considered done.
- Role- and project-scoped access (e.g. interns see only their project and their own tasks).

2.2 Roles and access

Role	Projects visible	Tasks visible	Can assign	Can approve
Project Manager	All projects	All tasks	Yes, to any division or person; assigns divisions to projects	Yes — final (stage 2) approval on all tasks
Division Leader	Projects their division is on	Tasks they assigned + tasks in their division	Yes, within their division	Yes, for their division — stage 1 of 2; PM gives final approval
Staff	Projects they are a member of	Tasks in those projects	Yes, to members of their own projects	No
Intern	Their assigned project(s) — may be more than one	Only their own tasks	No	No

2.3 Task record

- Title, description, project, division
- PIC / assignee, assigned by, assigned date
- Deadline, priority
- Status: To do → In progress → Blocked → Submitted → Leader approved → PM approved. A rejection at either stage (comment required) returns the task to In progress.
- Blocker reason (mandatory when status = Blocked)
- Activity log: status changes and approvals with who and when; completion date
- Shareable task link (used in chat)

2.4 Screens

1. **Projects overview** — card/table per project: PIC, open / blocked / overdue counts, next deadline.
2. **Project detail** — task board (Kanban by status) and list view; filters by division, assignee, status.
3. **Task detail drawer** — fields above, activity timeline, approve / reject / request approval actions.

4. **My tasks** — personal inbox of tasks assigned to me and approvals waiting on me.
5. **Blocked & overdue report** — all blocked tasks with reasons, grouped by project.
6. **Team & access admin** (PM only) — assign divisions and members to projects, set roles.

3. Module A — Team Chat (Discord-style)

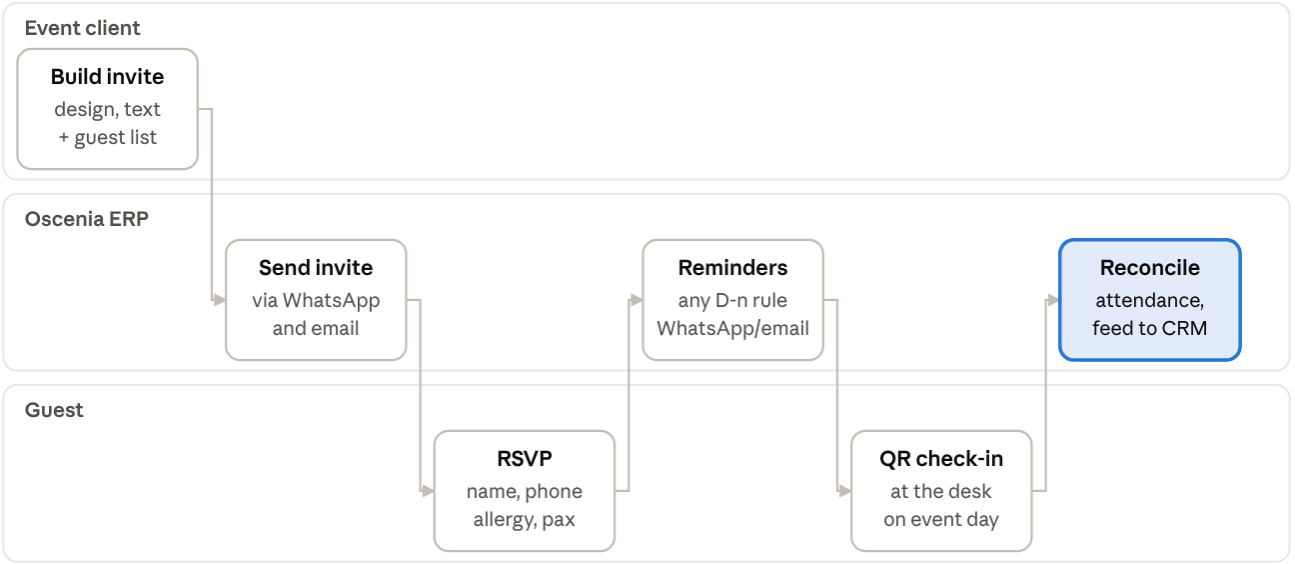

Internal work discussion moves into the ERP: each project gets its own channels, access follows the same project permissions, and messages can mention people and link to tasks.

- **Channel structure:** server-like sidebar — one group per project (Project A, B, C, D) with text channels inside (e.g. #general, #division-name), plus company-wide channels such as #announcements.
- **Phase 1 scope:** text channels only. Direct messages, voice and video are deferred to a later phase.
- **Access:** a user sees only channels of projects they belong to; interns see only their projects' channels. PM sees all. Private channels restricted to named members.
- **Messaging:** send text, @mention a person (notifies them), @division or @channel mentions, emoji reactions, reply in thread, attach files/images.
- **History and moderation:** history kept indefinitely. Authors can edit or delete their own messages within 15 minutes (shown as "edited" / "message deleted"). The PM can delete any message.
- **Task links:** paste or insert a task link; it renders as a card (title, status, PIC, deadline) that opens the task. Option to create a task from a message.
- **Notifications:** unread badges per channel, mention count, in-app notification.
- **Search:** by keyword, person, channel.

4. Module B — Event Invitation, RSVP and Check-in

Oscenia's event clients build their own invitation website from a template, guests RSVP on it, and Oscenia staff track responses, send reminders and check guests in by QR on the day.

An invitation becomes attendance data and CRM contacts in six steps

guest journey · 3 parties, 6 steps

The client owns the design and guest list; the ERP handles sending, reminders and reconciliation; the guest only touches the RSVP page and the check-in desk.

4.1 Invitation builder (client-facing)

- Start from an Oscenia template; edit colours, fonts, photos and all copy (event name, date, venue, schedule, dress code, map).
- Live preview (desktop and mobile), save draft, publish to a unique link.
- Event clients edit through a **private edit link** — no ERP login required.
- Toggle the RSVP section on/off and choose which RSVP fields to ask.
- Upload the master guest list (name, phone, email, optional table) via CSV or manual entry.

4.2 RSVP form (guest-facing)

- Fields: name, phone number, email, food allergies / dietary notes, number of pax attending, attending yes/no.
- Marketing consent checkbox (feeds the CRM; unticked by default).
- On submit: confirmation page + personal QR code, also sent by WhatsApp/email.

4.3 Event dashboard (Oscenia staff)

- Counts: invited, RSVP yes, RSVP no, not responded, total pax, allergy summary.
- Guest table matched against the client's master list: who has RSVP'd, who has not.

- Table assignment: Oscenia staff assign tables before the event (a table column in the client's CSV can pre-fill it); tables stay editable at the check-in desk.
- Reminder rules configured by the Oscenia team: any number of D-n timings (e.g. D-7, D-3), each with an audience (attending / non-responders), channel (WhatsApp, email or both) and editable template; send log.

4.4 QR check-in (event day)

- Registration-desk screen: scan the guest's QR (camera) or search by name/phone; shows guest name, pax, allergy note and assigned table.
- Mark arrived with timestamp; live arrived counter.
- **Walk-ins:** the desk displays a walk-in QR. The guest scans it, fills a short form (name, phone, email, marketing consent) and is checked in as a walk-in and added to the CRM.

4.5 Post-event attendance reconciliation

	Attended	Did not attend
RSVP'd yes	RSVP'd and came	RSVP'd but no-show
Did not RSVP	Walk-in (no RSVP, came)	No RSVP, did not come

Each bucket is a filterable list, exportable to CSV.

5. Module B — CRM

The CRM has two jobs: pool every guest contact from every event into one consented marketing database, and track Oscenia's client companies and their PICs so staff know when to reach out.

5.1 Part 1 — Guest contact database

- Auto-import contacts from every event's RSVP (e.g. 10 events → thousands of phones and emails) into one list.
- De-duplicate by phone / email; keep history of which events each contact attended.
- Marketing consent flag + date + source event; only consented contacts are eligible for marketing blasts.
- Filters (event, consent, attended, date range), segments, CSV export.
- Marketing blast (email / WhatsApp) to a segment — prototype shows compose + audience count only.

5.2 Part 2 — Client relationship tracking

- **Companies:** name, industry, notes, company anniversary date.
- **Contacts (PICs):** e.g. Ms Layla at Company A — phone, email, role, birthday.
- **Event history per company:** past, current and upcoming events (e.g. Gathering 2025, Gathering 2026), with month held and PIC.
- **Event-cycle nudges:** the system detects each company's usual event month (e.g. July) and creates a reminder 3 months before (April) for staff to reach out; nudge lead time configurable.
- **Greetings automation:** automatic WhatsApp and email message on PIC birthdays and company anniversaries, from editable templates; staff can switch off per contact.
- **Upcoming view:** calendar / list of nudges, birthdays and anniversaries due in the next 30/60/90 days.

5.3 Screens

1. Contacts list (guest database) with consent and event filters.
2. Companies list and company detail (PICs, event timeline, notes, next nudge).
3. Relationship calendar — nudges, birthdays, anniversaries.
4. Automation settings — message templates, lead times, WhatsApp/email channel.

6. Non-functional requirements, scope and assumptions

Non-functional (for the backend phase)

- Role-based access enforced server-side, not just hidden in the UI.
- Chat near real-time (target under 2 s message delivery).
- Guest-facing invitation and RSVP pages mobile-first, fast on 4G, no login.
- Personal data (phone, email, allergies) handled to the Singapore PDPA baseline (consent, stated purpose, unsubscribe); Indonesia's PDP Law (UU 27/2022) likely also applies to Indonesian guests and is to be confirmed before go-live; marketing only with recorded consent and an unsubscribe path.
- WhatsApp sending via Oscenia's existing WhatsApp Business account (WhatsApp Business Cloud API) with pre-approved templates.

Out of scope for the prototype

- Any backend, database, real messaging, real WhatsApp/email sending, real QR scanning (simulated).
- Chat DMs, voice and video (later phase); payments/ticketing for events.

Assumptions

- Both modules live inside the existing Oscenia ERP and reuse its login, layout and design system.
- The invitation builder and RSVP page are public pages reached by link; the builder is used by event clients through a shareable edit link.
- "AI system for WhatsApp" means automated scheduled messaging; AI-written replies are not assumed.

7. Client decisions (resolved open questions)

All 12 open questions from v0.1 were answered by the client; the requirements above already reflect them.

#	Question	Decision
1	Can Staff assign tasks?	Yes, to members of their own projects. Interns cannot.
2	Who approves?	Both, in sequence: Division Leader, then PM.
3	Intern on several projects?	Yes; still sees only own tasks.
4	Chat scope	Text channels first; DMs, voice, video later.
5	Message history and edits	Kept indefinitely; own edits/deletes within 15 min; PM can delete any.
6	Client login for builder?	No login; private edit link.
7	Table assignment	Oscenia staff before the event; editable at the desk.
8	Reminder timing	Configurable by the Oscenia team (any D-n, audience, template).
9	WhatsApp provider	Oscenia's existing WhatsApp Business account.
10	Walk-ins into CRM?	Yes, by scanning a walk-in QR at the desk.
11	Greeting channels	WhatsApp and email.
12	Data-protection regime	Singapore PDPA baseline; Indonesian PDP Law to confirm before go-live.

8. Prototype plan

The prototype is built front-end only inside the existing ERP prototype (React + Vite + Zustand, in-memory mock data), and backend work starts only after the client says yes.

- **Where:** `erp-prototype/`, reusing its layout, sidebar, role switcher and UI kit. The existing Projects and CRM pages are extended, not duplicated.
- **Data:** seeded mock data (4 projects, divisions, users per role, tasks, chat channels, 2 events with guests, companies with PICs and event history); state resets on refresh.
- **Simulated:** WhatsApp/email sends (logged, not sent), QR scanning (click-to-scan / search), real-time chat (local only).
- **Demo path:** switch role (PM → Division Leader → Intern) to show access differences; walk an event from invite build → RSVP → check-in → reconciliation → CRM.
- **Gate:** client reviews the prototype against this BRD; on sign-off, backend design (data model, APIs, WhatsApp provider) begins.
